

AI Request Triage Assistant

Build a simple AI-powered tool that turns an unstructured business request into a clear, actionable next step.

TIME LIMIT	FORMAT	SUBMISSION
48 hours from receipt	Code, no-code, or hybrid	Video walkthrough + access or files

The mock problem

A growing professional-services company receives client requests through email, website forms, and chat. Team members manually read each message, decide how urgent it is, determine who should handle it, and write an initial response. Important requests are sometimes delayed or sent to the wrong person.

Your job is to create a working prototype that makes this process faster and more consistent.

What your solution must do

- Accept a written request as input.
- Return a short summary of the request.
- Assign one category: Sales, Support, Billing, Technical, or Other.
- Assign a priority: Low, Medium, High, or Urgent, with a brief reason.
- Route the request to one owner: Sales Team, Client Success, Finance, or Engineering.
- Draft a professional first response that a team member could review and send.
- Present the results in a clear interface or workflow.

Rules and expectations

Use any stack	Python, JavaScript, workflow tools, AI builders, or another approach are all acceptable.
AI use is allowed	You may use AI while building. You must understand and be able to explain every important part of your solution.
Keep it practical	A focused working prototype is better than a large unfinished system. Do not spend money to complete this challenge.
Protect information	Use only the mock requests below. Do not use private, confidential, or real client information.

Mock requests

Your solution should handle all six examples. It should also accept new requests that are not listed here.

#	INCOMING REQUEST
01	Our team has 40 employees entering the same customer details into three systems. Could you show us how this might be automated? We would like to speak next week.
02	The client portal has been unavailable since this morning and our staff cannot access active customer records. Please help as soon as possible.
03	Invoice NS-1048 appears to include the same implementation charge twice. Can someone review it before payment is processed Friday?
04	Can you add dark mode and change the dashboard font? There is no deadline. I am collecting ideas for a future update.
05	We accidentally uploaded a spreadsheet containing customer contact information to the wrong workspace. We need immediate help removing access.
06	I saw your company online and am interested in a custom AI reporting system. What would pricing and a typical timeline look like?

What to submit

- A 5-8 minute video showing the solution working and explaining how you built it.
- A demonstration using at least three mock requests, including request 05.
- A brief explanation of your decisions, AI logic or prompts, limitations, and what you would improve next.
- A working link, repository, exported workflow, or project files so the team can review your work when practical.

How to send it

Reply to the email that included this challenge. Include your video link and any project link or files. Make sure access permissions work before submitting. Your submission is due 48 hours after the challenge was sent to you.

How we will evaluate it

AREA	WHAT WE ARE LOOKING FOR	WEIGHT
Functionality	The main workflow works reliably from input to output.	30%
AI judgment	Classification, priority, routing, and responses are sensible.	25%
Problem solving	Your choices are practical, thoughtful, and clearly explained.	20%
User experience	The solution is simple to understand and use.	15%
Communication	The video is clear, direct, and demonstrates ownership of the work.	10%

We are not expecting a production-ready product. We want to see how you think, build, make tradeoffs, and explain your work.
